The **Savannah™** has been object of a continuous developing process that, during the years, have produced remarkable improvements, both concerning the speed and safety performances, and the aesthetic look. This new evolution has produced a completely new design aircraft that has been renamed **Savannah™ S**.

The **Savannah™ S** is I.C.P.'s 2010 innovation. It was born from the wish to make the **Savannah™** more refined and elegant and complete the aesthetical improvement process already started last year with the **Savannah™ XL**, whose front part fuselage was completely modified. This year we have paid attention to the back side of the aircraft.

We have left the wings unchanged, because they have always proved to be the key force of the **Savannah™**, above all in VG (vortex generators) version, thanks to the combination of the wide wing surface with the high lift profile.

The object of restyling 2010 has been the tail trunk; we have removed the corners, so the typical squared shape has been replaced by a sinuous bending that gives harmony and completeness to the whole aircraft, without taking away the well known features of solidity and safety.

Optional Instruments panel

The **Savannah™ S** can be customized depending on the pilot's needs, thanks to the wide range of available options. The instruments panel, wider and more spacious, can contain the more recent technological innovations.
